Tailorly — Product Add-Ons for WooCommerce: User Guide

Tailorly adds extra options to your WooCommerce products — engraving text, gift wrap, a colour choice, a logo upload — each free or with its own price. Shoppers fill them in on the product page, see the total update live, and everything they chose follows the item into the cart, the order, the admin order screen and the order emails.

Version 1.0.0 · Requires WordPress 6.4+, WooCommerce 8.0+, PHP 7.4+.

---

1. Installation

1. In WordPress go to **Plugins** → **Add New** → **Upload Plugin**.
2. Choose the zip you downloaded (`woo-product-addons-free.zip` for Free, `woo-product-addons.zip` for Pro) and click **Install Now**, then **Activate**.
3. WooCommerce must be active. If it is not, Tailorly shows a notice and does nothing else.
4. A new menu **Product Add-Ons** appears in the admin sidebar, below Products.

Upgrading from Free to Pro

Your field groups and settings are kept. Either upload the Pro zip over the Free one (WordPress offers "Replace current with uploaded"), or deactivate and delete Free first — data is only removed on delete if you turned on **Delete all plugin data** in Settings (it is off by default).

2. Licence activation (Pro)

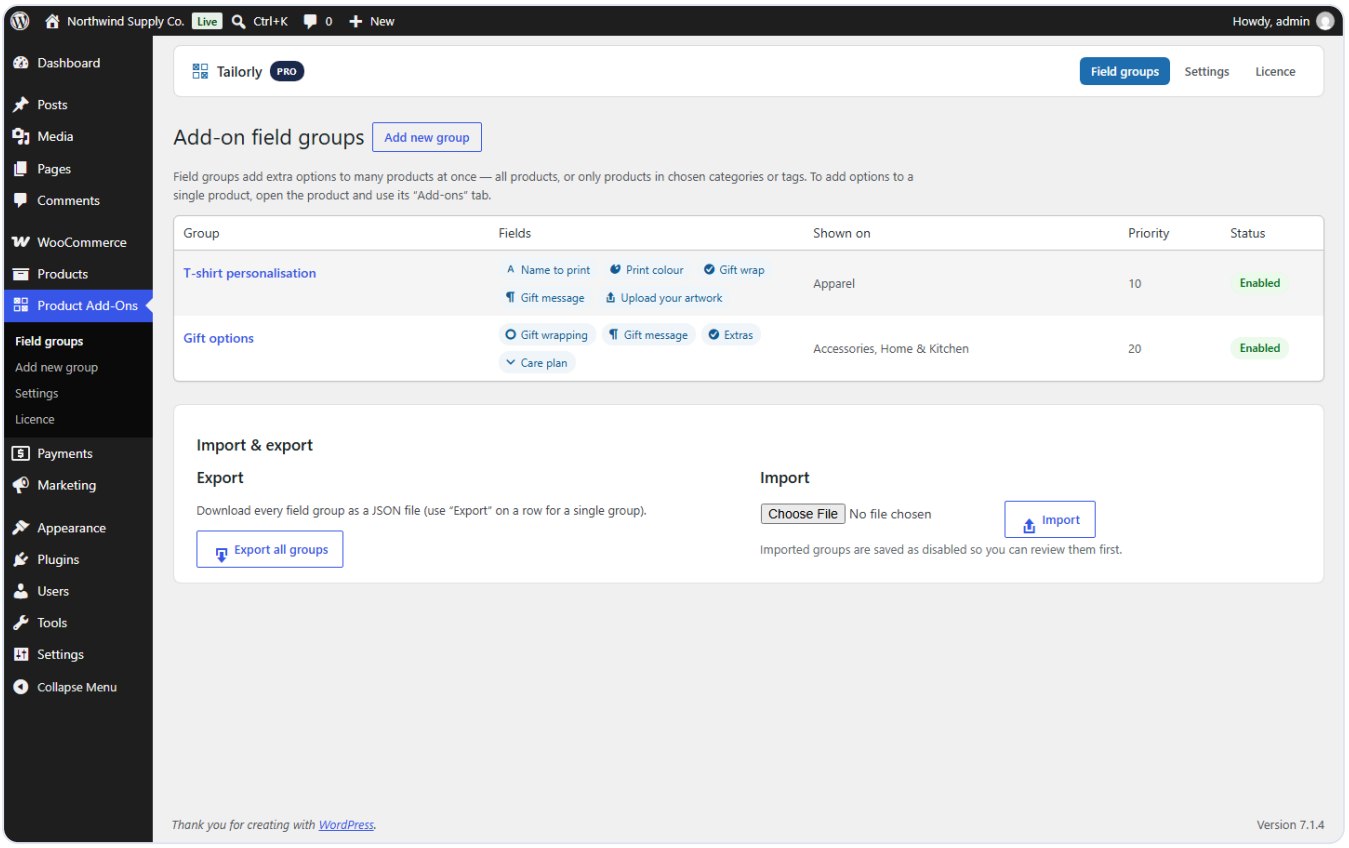

1. Go to **Product Add-Ons** → **Licence**.
2. Paste the licence key from your Code Craft purchase email and click **Activate licence**.
3. The status changes to **Active** and the Pro field types, pricing types and tools unlock.

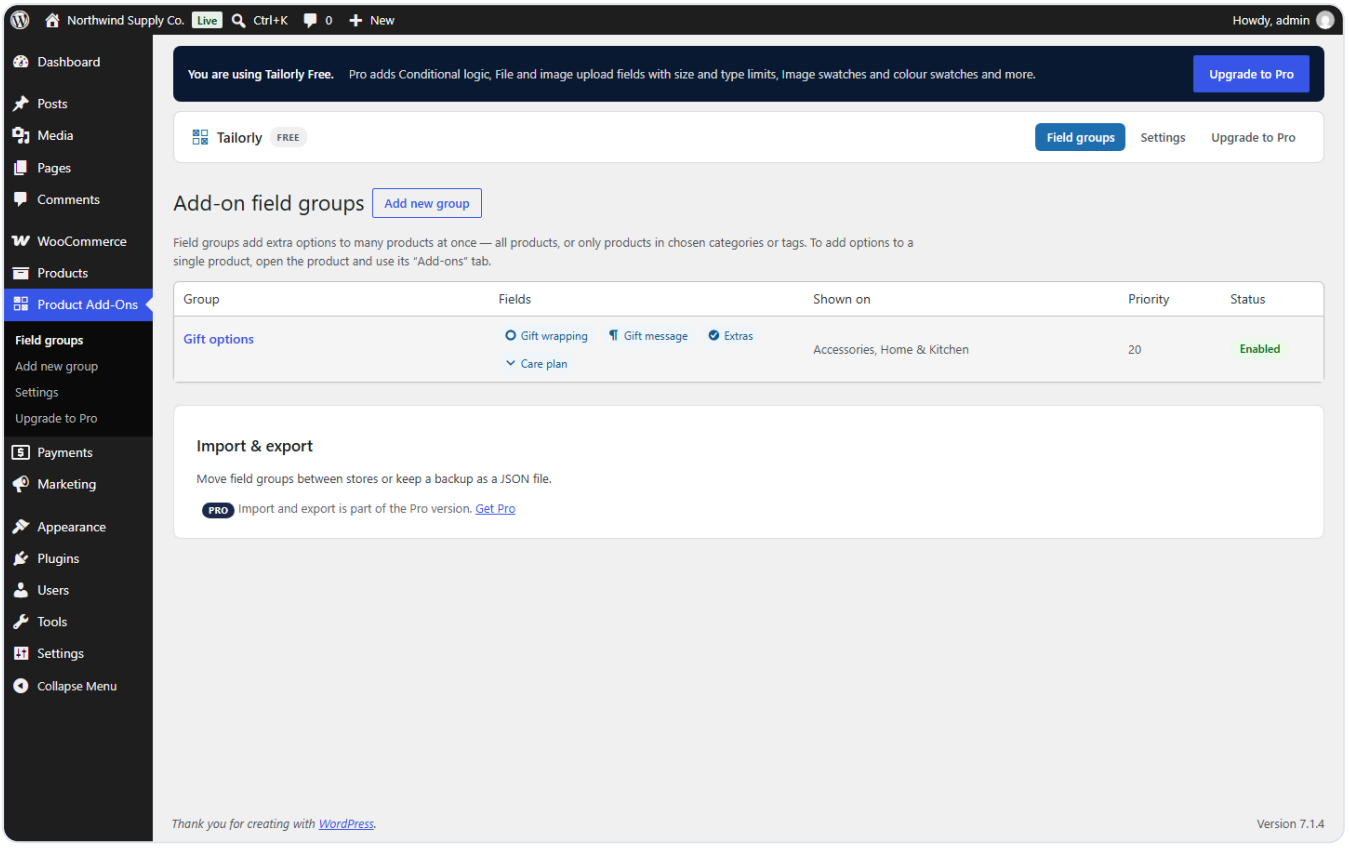

To move the licence to another site, click **Deactivate on this site** first. When a monthly or yearly licence ends, the Pro features switch off (the free features and all your settings are kept) and switch back on as soon as you renew; use **I have paid — check again** on the licence screen after paying. Lifetime licences never end. Lost your key? It is in your account at coodecraft.com/account.

---

3. Field groups list

Screenshot: (Free:)

Product Add-Ons → Field groups lists every group with:

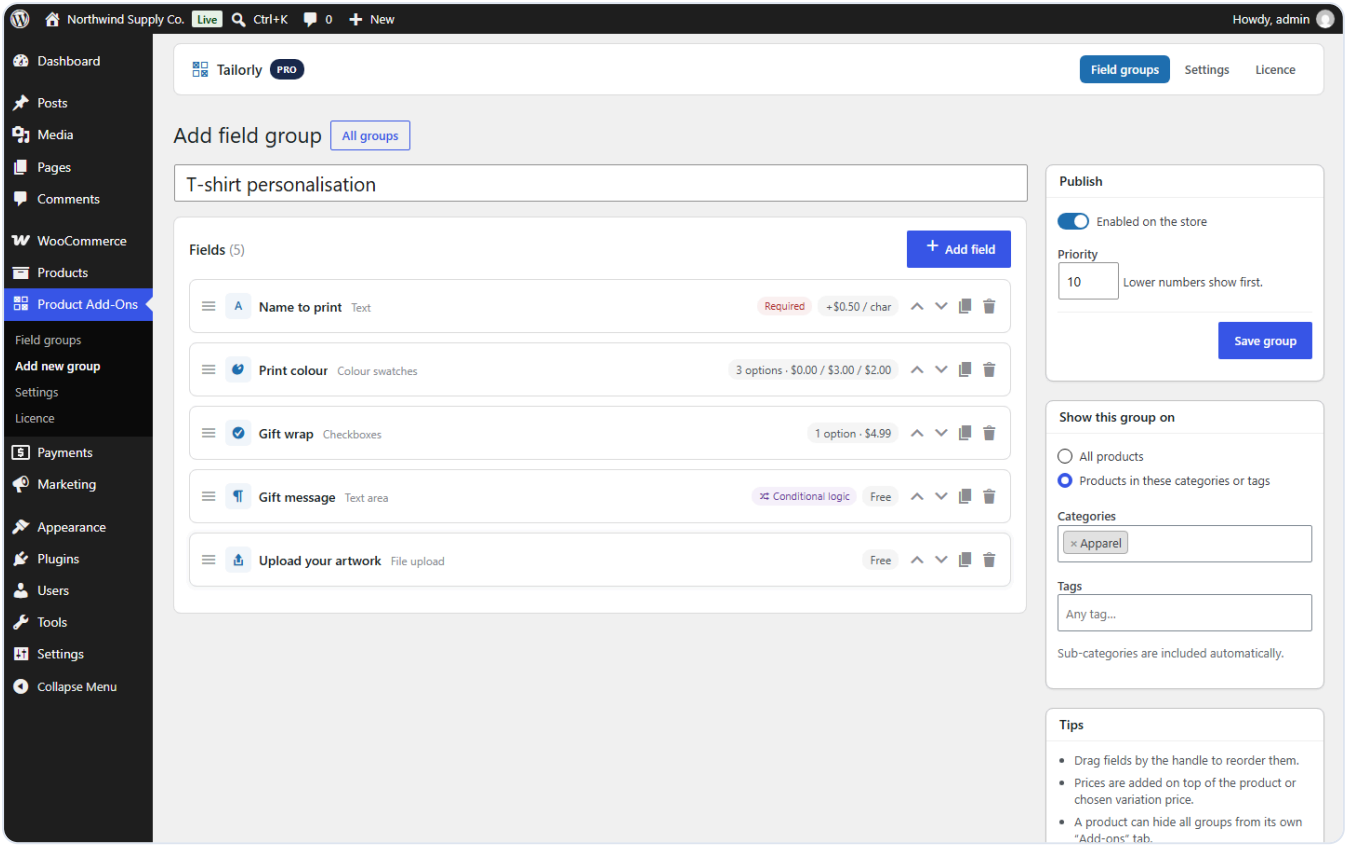

- **Group** — the name. Hover a row for **Edit**, **Enable/Disable**, **Delete**, and in Pro **Duplicate** and **Export**.
- **Fields** — the fields in the group with their type icons.

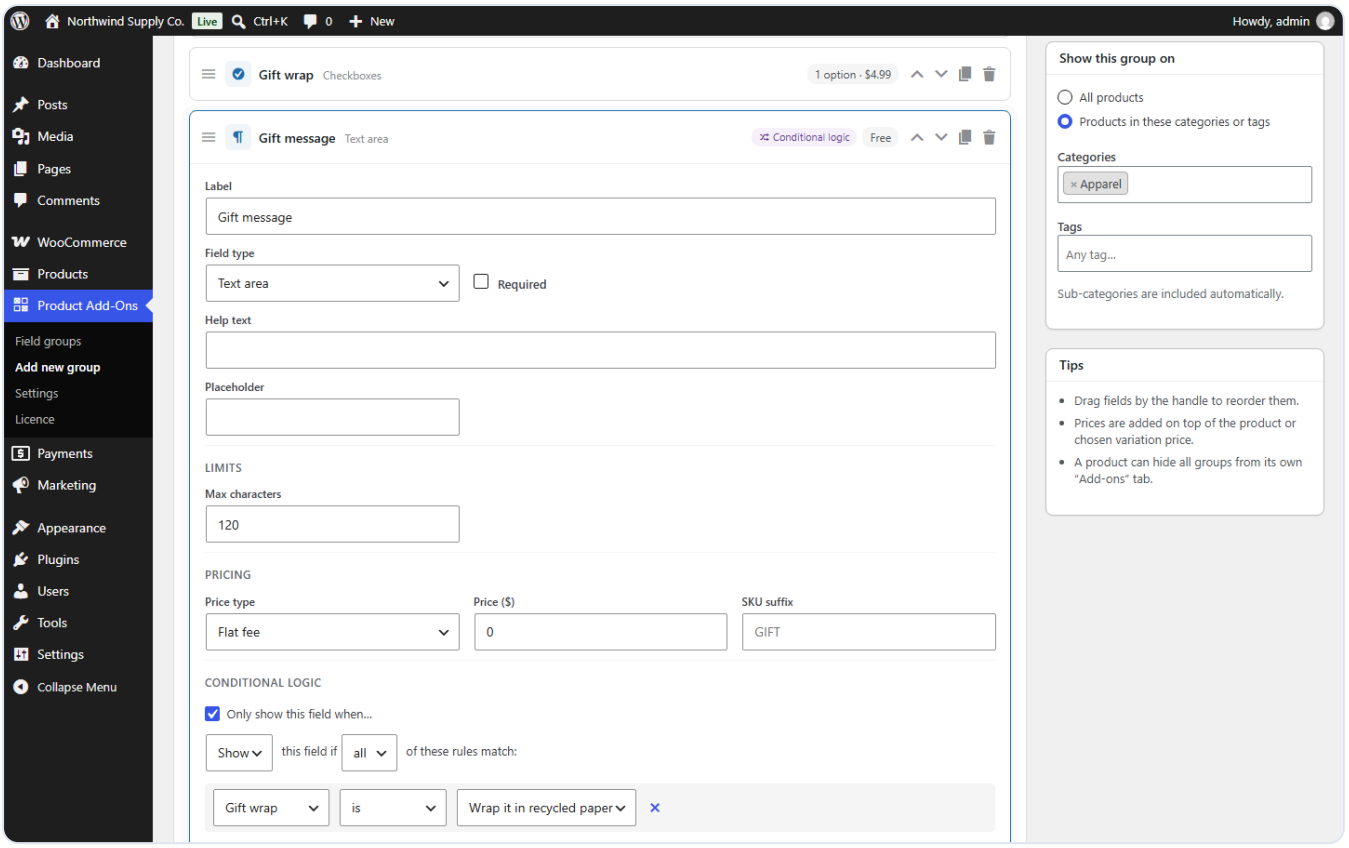

- **Shown on** — "All products" or the categories/tags it targets.
- **Priority** — lower numbers show first on the product page.
- **Status** — Enabled groups show on the store; Disabled groups are kept but hidden.

Below the table is the **Import & export** card (Pro). See section 9.

4. Creating a field group

Screenshots: ,

1. Click **Add new group**.
2. Type a **group name** (for example "Personalisation"). It is shown as a heading above the fields on the product page (you can turn headings off in Settings).
3. Click **Add field** and pick a field type (see section 5). The new field opens so you can set it up.
4. In the right-hand **Show this group on** box choose **All products**, or **Products in these categories or tags** and pick them. Sub-categories are included automatically.
5. In **Publish**, leave **Enabled on the store** on and set a **Priority** if you have several groups.
6. Click **Save group**.

Working with fields

Each field is a card. Click its title to open or close it.

- **Drag** the ☰ handle, or use the ▲ ▼ arrows, to reorder fields.
- The copy icon **duplicates** a field; the bin **deletes** it.
- The card header summarises the field: Required badge, Conditional logic badge, and its price(s).

Field settings

- **Label** — what shoppers see.
- **Field type** — switch between compatible types (e.g. dropdown ↔ radio).
- **Required** — the shopper cannot add to cart until this is filled in.
- **Help text** — a short hint shown under the label.

- **Placeholder** — grey example text inside text boxes; for dropdowns it is the empty first choice ("Choose an option…" by default).
- **Limits** — *Max characters* for text fields (with a live "characters left" counter); *Minimum/Maximum/Step* for number fields; *Earliest/Latest date* (days from today) for date fields; *Max file size* and *Allowed file types* for uploads.

Options (dropdown, radio, checkboxes, swatches)

Each option has a **label**, a **price**, and a price unit — **$** (flat amount) or **%** (percentage of the product price). Tick **Default** to pre-select an option. In Pro you can also set a **SKU suffix**, a **colour** (colour swatches) or an **image** from the Media Library (image swatches). Use **Add option** to add more and drag ☰ to reorder.

5. Field types

Type	Edition	Notes
Text	Free	One line. Optional max characters.
Text area	Free	Several lines. Optional max characters.
Dropdown	Free	One choice from a list.
Radio buttons	Free	One choice, all options visible.
Checkboxes	Free	Any number of choices.
Colour swatches	Pro	One choice shown as round colour chips.
Image swatches	Pro	One choice shown as images.
Number	Pro	With minimum, maximum and step.
Date picker	Pro	The browser's date picker, limited to a range of days from today.
File upload	Pro	Size limit and type allow-list (JPG, JPEG, PNG, GIF, WEBP, PDF).

6. Pricing

Prices are always added on top of the product price — for variable products, on top of the price of the variation the shopper picks.

Price type	Edition	How it is calculated (per item)
Flat fee	Free	The amount, when the field is filled in / the option chosen.
Percentage of product price	Free	That % of the product or variation price (sale price when on sale).

Price type	Edition	How it is calculated (per item)
Per character	Pro	Price × characters typed (spaces are not counted). Text and text area only.
Per unit entered	Pro	Price × the number entered. Number fields only.
Formula	Pro	Your own formula, see below.

Negative prices work as discounts. The line price never goes below zero.

Formula pricing (Pro)

Variables: `{price}` product price, `{value}` the number entered, `{chars}` characters typed, `{qty}` quantity in the cart. Operators `+ - * /` and parentheses. Functions `min`, `max`, `ceil`, `floor`, `round`, `abs`.

Examples:

- `max(5, {chars} * 0.75)` — 75¢ per character, minimum $5.
- `{price} * 0.1 + 2` — 10% of the product price plus $2.
- `{value} * 1.5 - min({qty}, 10) * 0.05` — per unit with a small bulk discount.

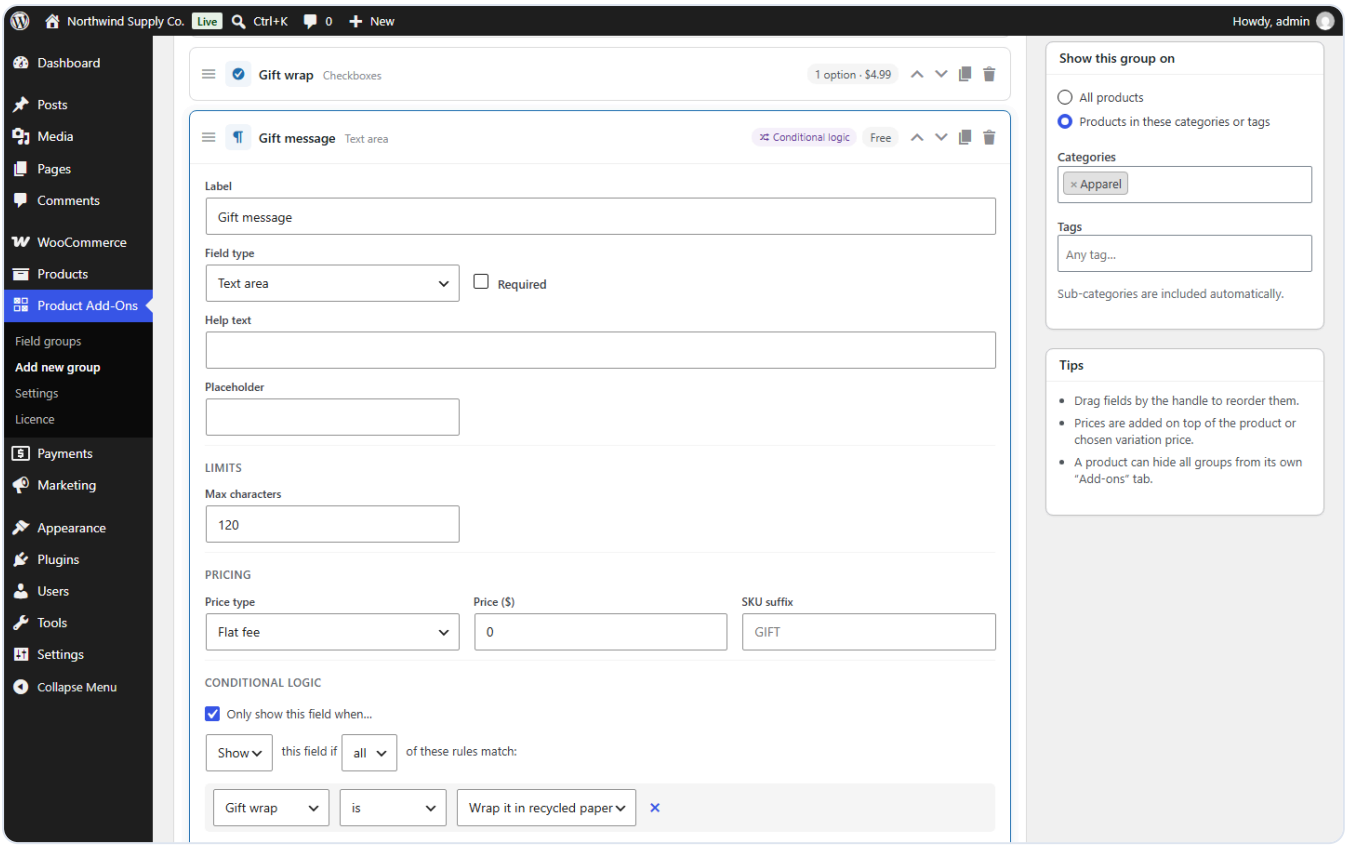

An invalid formula prices the field at $0, so double-check it on the product page — the live total uses the same formula.

Security: the browser only sends which options were chosen and what was typed. Every price in the cart and on the order is recalculated on the server from your saved settings.

---

7. Conditional logic (Pro)

Screenshot:

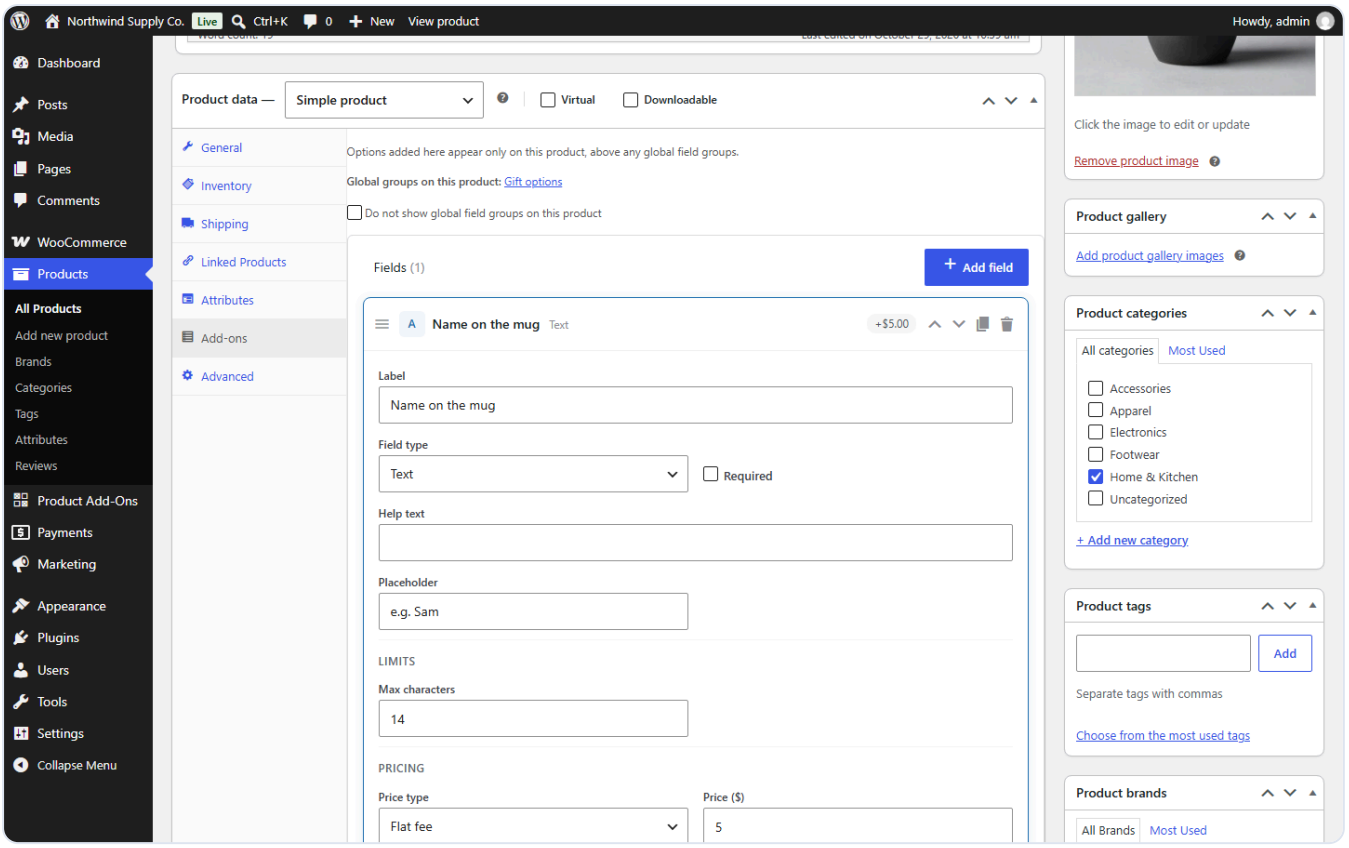

Open a field, tick **Only show this field when…**, then build a sentence such as **Show** this field if **all** of these rules match: *Gift wrap* **is** *Wrap it in recycled paper*.

- Operators: **is**, **is not**, **is empty**, **is not empty**. For choice fields you pick the option; for text fields you type the value (not case-sensitive).
- **all** = every rule must match; **any** = one is enough. **Hide** inverts the result.
- Rules can only use fields in the same group (or the same product tab).
- Hidden fields are never required, never charged and never saved — this is checked on the server too. Chains (A shows B, B shows C) work.

---

8. Per-product add-ons (product "Add-ons" tab)

Screenshot:

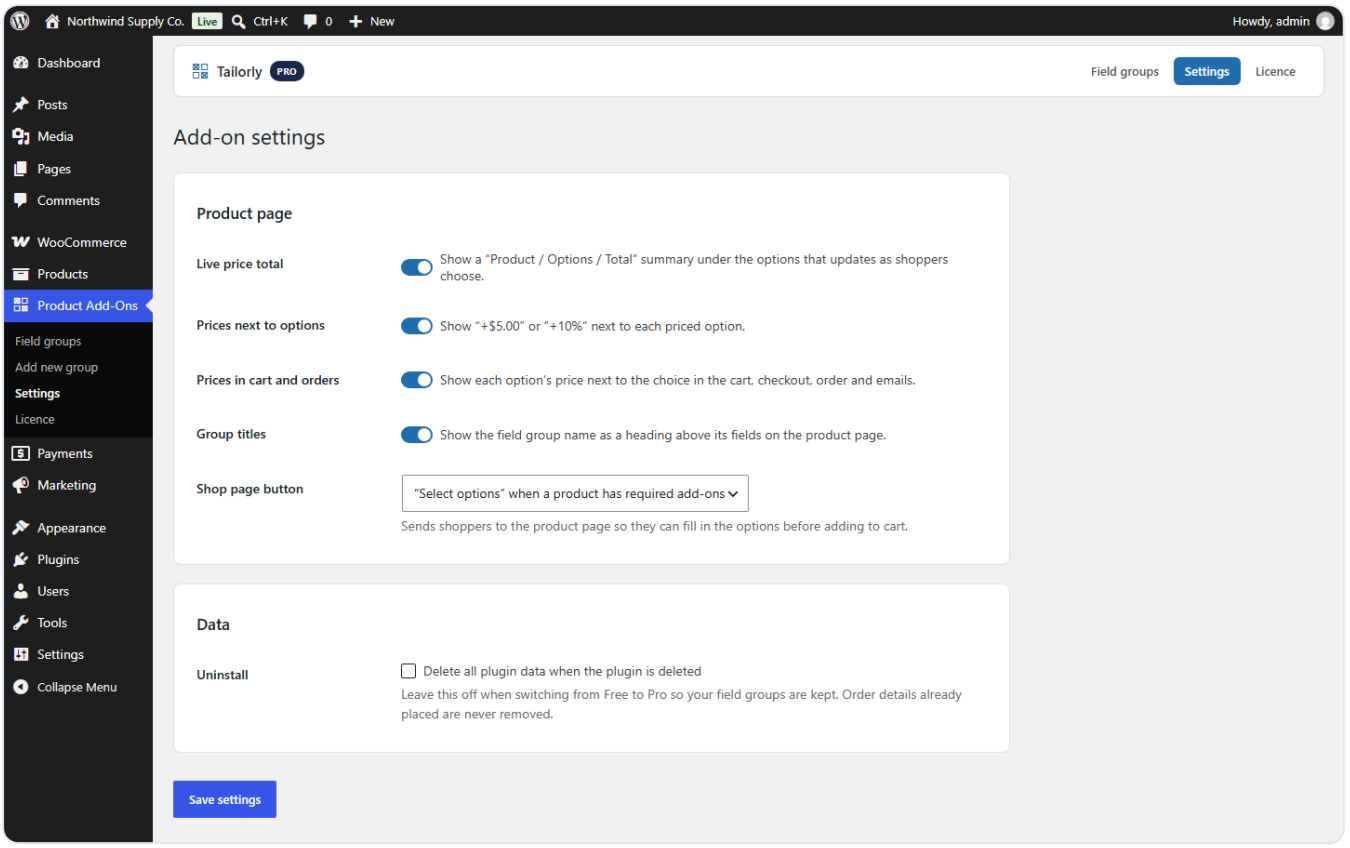

Open any product, scroll to **Product data** and click **Add-ons**. The same field builder appears; fields added here show only on this product, above any global groups. The tab also lists the global groups that apply, and has **Do not show global field groups on this product** to switch them off for this product. Click **Update** to save.

9. Duplicate, export and import (Pro)

- **Duplicate** (row action) copies a group as *disabled* with "(copy)" in the name.
- **Export** (row action) downloads one group; **Export all groups** downloads all of them as a JSON file.
- **Import** accepts that JSON file (max 2 MB). Imported groups are saved as *disabled* so you can review them first. Categories and tags are matched by slug; ones that do not exist on the new store are skipped.

10. Settings

Screenshot:

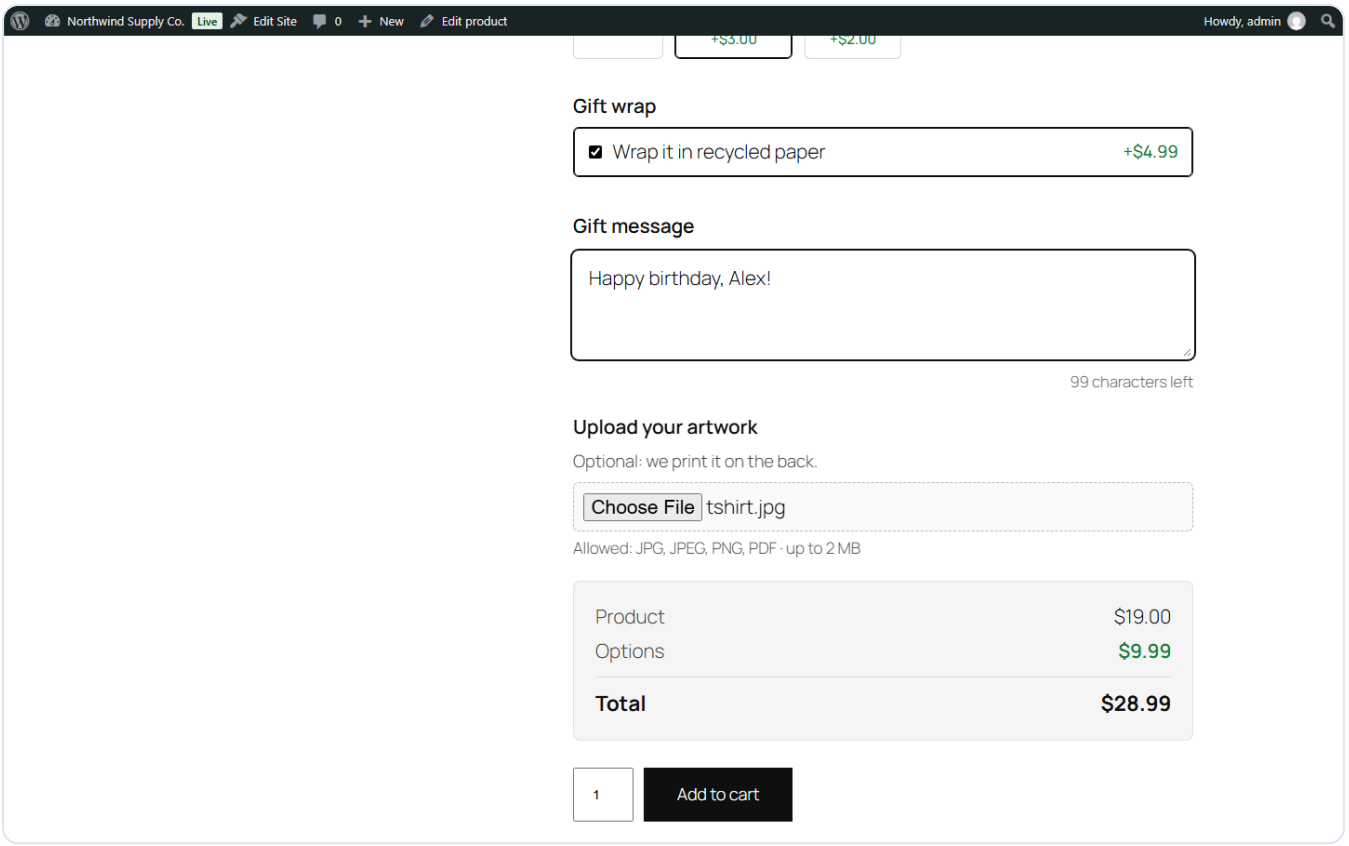

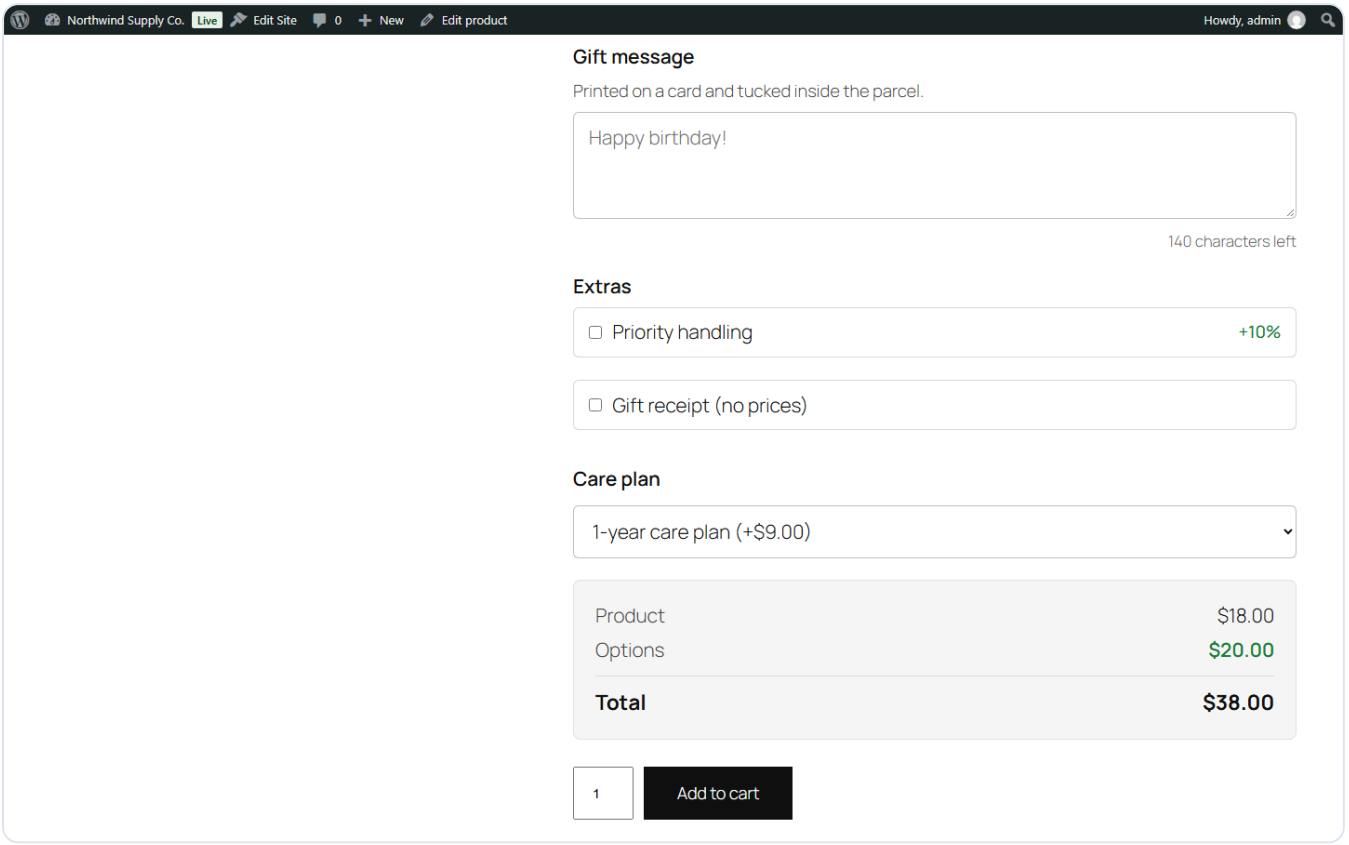

- **Live price total** — show the Product / Options / Total box under the options.
- **Prices next to options** — show "+$5.00" or "+10%" next to priced options.
- **Prices in cart and orders** — show each option's price next to the choice in the cart, checkout, order and emails.
- **Group titles** — show the group name as a heading on the product page.
- **Shop page button** — replace "Add to cart" with "Select options" on shop/category pages when a product has *required* add-ons (default), *any* add-ons, or *never*.
- **Delete all plugin data when the plugin is deleted** — off by default. When on, deleting the plugin removes field groups, per-product add-on settings and plugin options. Orders and uploaded files are never deleted.

Add to cart

- The fields appear above the quantity and **Add to cart** button, with prices next to options and the **Product / Options / Total** box updating as they choose (and when they change variation or quantity).
- Missing required fields are highlighted before the form is sent; the server checks again.

- Cart and checkout (classic and block) list every choice under the product, e.g. *Print colour: Metallic gold (+$3.00)*.
- The order confirmation page, the My Account order page and the order emails show the same list. **Order again** keeps the choices.

12. On the order (admin)

Screenshot:

Under each line item you see every choice and its price. With Pro you also see the **Option SKU** (product SKU + the SKU suffixes of the chosen options, e.g. `NW-001-NAME-GLD`) and a link to each uploaded file.

Uploaded files are stored in `wp-content/uploads/ocpa-uploads/YYYY/MM/` with random 20-character names. The folder gets an `index.php` and an `.htaccess` that disables directory listing and script execution. (On Nginx servers, `.htaccess` is ignored — random names still prevent guessing, but you may add `autoindex off;` for that folder.)

FAQ

Does it work with variable products? Yes — add-on prices are added to the chosen variation's price, and percentage prices use that variation's price.

Does it work with the block cart and checkout? Yes, both block and classic.

Can I have different options per product? Yes: use the product's Add-ons tab, or target groups by category/tag.

Does it slow my store down? Groups are cached and front-end files load only on product pages that have add-ons.

Are prices shown including tax? On the product page the live total uses the product's displayed price (following your tax display setting); the cart uses WooCommerce's normal tax handling of the line price.

Can shoppers edit options in the cart? Not in 1.0 — they remove the item and add it again with new choices.

Troubleshooting

- **Options don't show on a product.** Check the group is *Enabled*, its categories/tags match the product, and the product's Add-ons tab does not have *Do not show global field groups* ticked. Products of type *grouped* and *external* do not support add-ons.
- **Add to cart on the shop page goes to the product page.** That is the "Shop page button" setting; products with required options must be configured on the product page.
- **"The file … is too large".** Raise the field's Max file size, and check your server's `upload_max_filesize` / `post_max_size` PHP limits.
- **A Pro field type is missing on the product page.** Pro fields only show while a Pro licence is active (or expired) — check **Product Add-Ons → Licence**.
- **A formula always gives $0.** The formula has a syntax error or uses an unknown variable; only `{price}`, `{value}`, `{chars}`, `{qty}` are supported.
